

Focus: Hedgerows and forest edges – valuable structures in farmland

Preference for forest edge habitat of 50 species based on the territory mapping surveys in kilometre squares in 2013–2016. The chart shows the percentage of observations on the forest edge (the outermost 50m of forest, light green) and in the forest interior (dark green). The red line marks the average area of forest interior in the surveyed kilometre squares (41.3%).
